

### **Notes from sifting through the images**

1. Currently including all the images with clear objects in foreground, even those that look quite similar
2. Goldset has tons of nonegocentric images of Sam
3. Is sand an object?
4. Including frames where the infant is looking in the mirror
5. Re: crowd of objects and telling to label single objects, there are images with coins and crayons in the center of view; it feels odd to label single objects here
  - a. Maybe we can add a plural label, and then when converting to json, we can id the plural labels with iscrowd=1?

### **Way I'm sifting through the images:**

1. Shuffled the images by organizing them by size, so I'd hit as many different images as possible
2. Tagging images as Green (Interesting) with:
  - a. clear objects in foreground
  - b. large object taking up >33% of view
  - c. objects that the infants seem to be engaging with
  - d. clear (but not foreground) objects in a whole room view with nothing clearly in the foreground
